

Knowledge Management Tool

Teams often struggle to find reports and information about their experience. This is especially true when the information storage processes are not robust or up to date enough.

The **Knowledge Management Tool (KMT)** allows for **storing data of any size and type** and makes it easy to perform any kind of queries by applying cutting edge computer vision and natural language processing algorithms. For example, associated reports and presentations can be found by **querying the system** with a detail from a picture.
